Chart

Latex, Latexit and MathJax

Latex is rendered using MathJax as a separate formula

`$$E=m*c^2$$`

or as an escaped bracket

`$$1+2+\dots+n=\frac{n(n+1)}{2}$$`

or using the equation array or inline as `$Q=Q_0*\exp(\{-\alpha*t\})$` or in escaped parenthesis `$1+2+\dots+n=\frac{n(n+1)}{2}$` .

Users can export the page to Tex and process it. Pages containing latex code can be exported to OpenOffice and to PDF files, equations will be included in latex notation, however.
