

# Weibull Plotting Position

The Weibull Plotting Position is defined as

$$P(x > X) = \frac{m}{N+1}$$

where:

$m$  : rank of the statistical variate

$N$  : total number of observations

$P$  : probability that the variate  $x$  exceeds the value  $X$  or  $P(x > X)$

Background and theory are discussed in depth by

Makkonen (2005)
